## **DETAILED ACTION**

### ***Claim Objections***

1. Claim 1 is objected to because of the following informalities: The sentence "performing communication via the via the repeater relay station" needs to be corrected with just one "via the". Appropriate correction is required.

### ***Claim Rejections - 35 USC § 103***

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over Janky (US Patent No. 5790527) in view of Schmutz (US Publication No. 20010031624).
4. As to claims 1, 2, and 3, Janky teaches a communication method used in a wireless communication system (abs) which includes both a repeater relay station of a wireless communication network using repeater system (fig. 2, #18) and a frequency division multiple access (FDMA) relay station of a wireless communication network using FDMA system (fig. 2, #14 and #12), the method comprising the steps of: receiving a call signal from a repeater wireless terminal (fig. 2, #16a) in the wireless communication network using repeater system, by the repeater relay station (fig. 2, #18); setting the forwarded call signal for a control signal at the FDMA relay station (col. 6, lines 40-50); transmitting the control signal to an FDMA wireless terminal (fig. 2, #16b) in the wireless communication network using FDMA system (fig. 2, #12 to #16b);

and performing communication via the repeater relay station (fig. 2, #18) between the FDMA wireless terminal (fig. 2, #16b and fig. 13, FDMA Radios) having received the control signal and the repeater wireless terminal.

5. Janky does not teach forwarding the call signal received by the repeater relay station to the FDMA relay station, but Schmutz teaches a signal transmission between a repeater relay station (Translator repeater station, fig. 1, # 12.1) and FDMA relay station (GSM Base Transceiver station, fig. 1, #15.1) in a telecommunication system. Thus, it would have been obvious to one of ordinary skill in the art at time the invention was made to modify the teachings of Janky with the configuration of Schmutz to efficiently acquire a communication session between terminals in a wireless communication network with two different operating systems.
